Disclaimer

You must read the following before continuing. The following applies to this document and the information provided in this presentation by Infant Bacterial Therapeutics AB (publ) (the "Company") or any person on behalf of the Company and any other material distributed or statements made in connection with such presentation (the "Information"), and you are therefore advised to carefully read the statements below before reading, accessing or making any other use of the Information. In accessing the Information, you agree to be bound by the following terms and conditions.

The Information does not constitute or form part of, and should not be construed as, an offer of invitation to subscribe for, underwrite or otherwise acquire, any securities of the Company or a successor entity or any existing or future subsidiary or affiliate of the Company, nor should it or any part of it form the basis of, or be relied on in connection with, any contract to purchase or subscribe for any securities of the Company or any of such subsidiaries or affiliates nor shall it or any part of it form the basis of or be relied on in connection with any contract or commitment whatsoever. Specifically, this presentation does not constitute a "prospectus" within the meaning of the U.S. Securities Act of 1933, as amended.

The Information may not be reproduced, redistributed, published or passed on to any other person, directly or in directly, in whole or in part, for any purpose. The Information is not directed to, or intended for distribution to or use by, any person or entity that is a citizen or resident of, or located in, any locality, state, country or other jurisdiction where such distribution or use would be contrary to law or regulation or which would require any registration or licensing within such jurisdiction. The Information is not for publication, release or distribution in the United States, the United Kingdom, Australia, Canada or Japan, or any other jurisdiction in which the distribution or release would be unlawful.

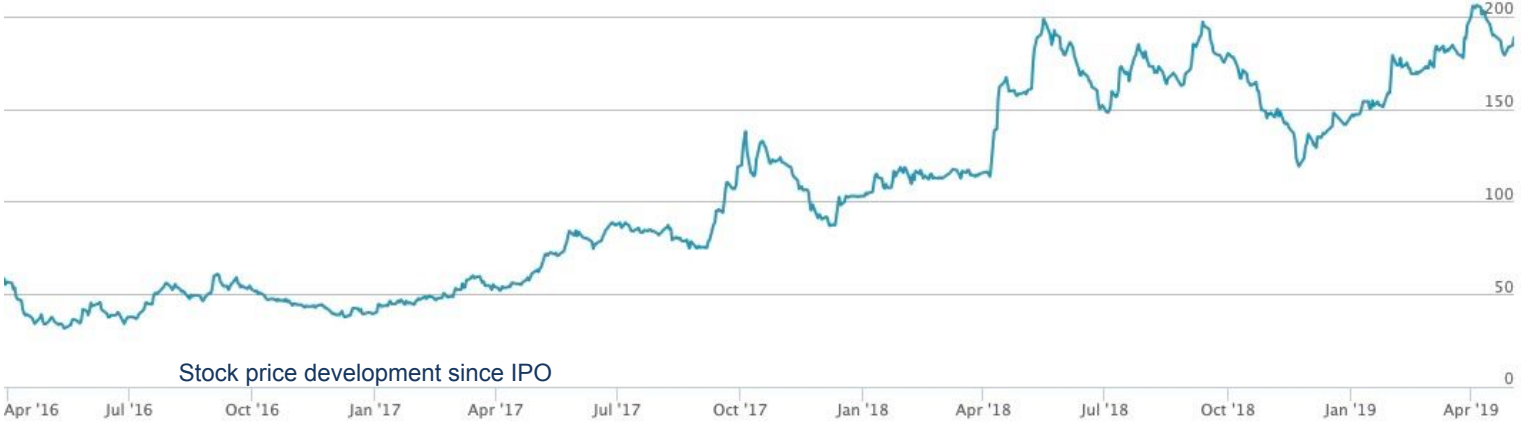
All of the Information herein has been prepared by the Company solely for use in this presentation. The Information contained in this presentation has not been independently verified. No representation, warranty or undertaking, express or implied, is made as to, and no reliance should be placed on, the fairness, accuracy, completeness or correctness of the Information or the opinions contained herein. The Information contained in this presentation should be considered in the context of the circumstances prevailing at that time and has not been, and will not be, updated to reflect material developments which may occur after the date of the presentation. The Company may alter, modify or otherwise change in any manner the content of this presentation, without obligation to notify any person of such revision or changes.

This presentation may contain certain forward-looking statements and forecasts which relate to events and depend on circumstances that will occur in the future and which, by their nature, will have an impact on the Company's operations, financial position and earnings. The terms "anticipates", "assumes", "believes", "can", "could", "estimates", "expects", "forecasts", "intends", "may", "might", "plans", "should", "projects", "will", "would" or, in each case, their negative, or other variations or comparable terminology are used to identify forward-looking statements. There are a number of factors that could cause actual results and developments to differ materially from those expressed or implied in a forward-looking statement or affect the extent to which a particular projection is realised. Factors that could cause these differences include, but are not limited to, implementation of the Company's strategy and its ability to further grow, risks associated with the development and/or approval of the Company's products candidates, ongoing clinical trials and expected trial results, the ability to commercialise IBP-9414 or IBP-1016, technology changes and new products in the Company's potential market and industry, the ability to develop new products, the impact of competition, changes in general economy and industry conditions and legislative, regulatory and political factors. While the Company always intends to express its best judgment when making statements about what it believes will occur in the future, and although the Company bases these statements on assumptions that it believe to be reasonable when made, these forward-looking statements are not a guarantee of its performance, and you should not place undue reliance on such statements. Forward-looking statements are subject to many risks, uncertainties and other variable circumstances. Such risks and uncertainties may cause the statements to be inaccurate and readers are cautioned not to place undue reliance on such statements. Many of these risks are outside of the Company's control and could cause its actual results to differ materially from those it thought would occur. The forward-looking statements included in this presentation are made only as of the date hereof. The Company does not undertake, and specifically decline, any obligation to update any such statements or to publicly announce the results of any revisions to any of such statements to reflect future events or developments.

Infant Bacterial Therapeutics AB

Corporate overview

- Founded in 2013 in Stockholm, Sweden as a subsidiary of BioGaia
- IPO in 2016, currently listed on Nasdaq Stockholm Mid-Cap
- Cash end of Q1 2019 MSEK 540, sufficient to fund development to market
- Planned Phase III start during H1 2019
- Market cap: MSEK 2 000



Stock price development since IPO

Corporate development since 2018 AGM

- List change to regulated market **Nasdaq Stockholm Mid-Cap** in September 2018

- Analyst coverage: SEB (Sweden) and Chardan (US) (not commissioned research)

First distribution deal for IBP-9414 in place

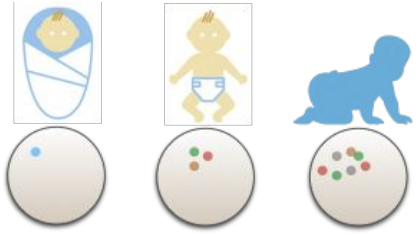
With Megapharm for IBP-9414 for the Israeli market and the Palestinian Authority's territories.

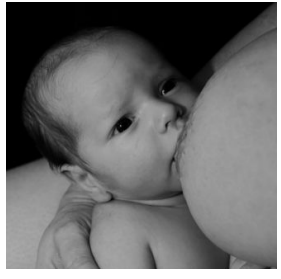
- Megapharm responsible for local registration, price negotiation and marketing
- IBT will receive 70% of revenue after an initial period
- Potential to include Israeli medical centers in Phase III trial

The IBT concept

Altering the human microbiome to treat diseases related to poor gut function

Newborn infant microbiome is dynamic





Human bacterial strains derived from human breast milk

Published proof-of-concept clinical signal

PEDIATRICS
OFFICIAL JOURNAL OF THE AMERICAN ACADEMY OF PEDIATRICS

Prophylactic Probiotics to Prevent Death and Nosocomial Infection in Preterm Infants

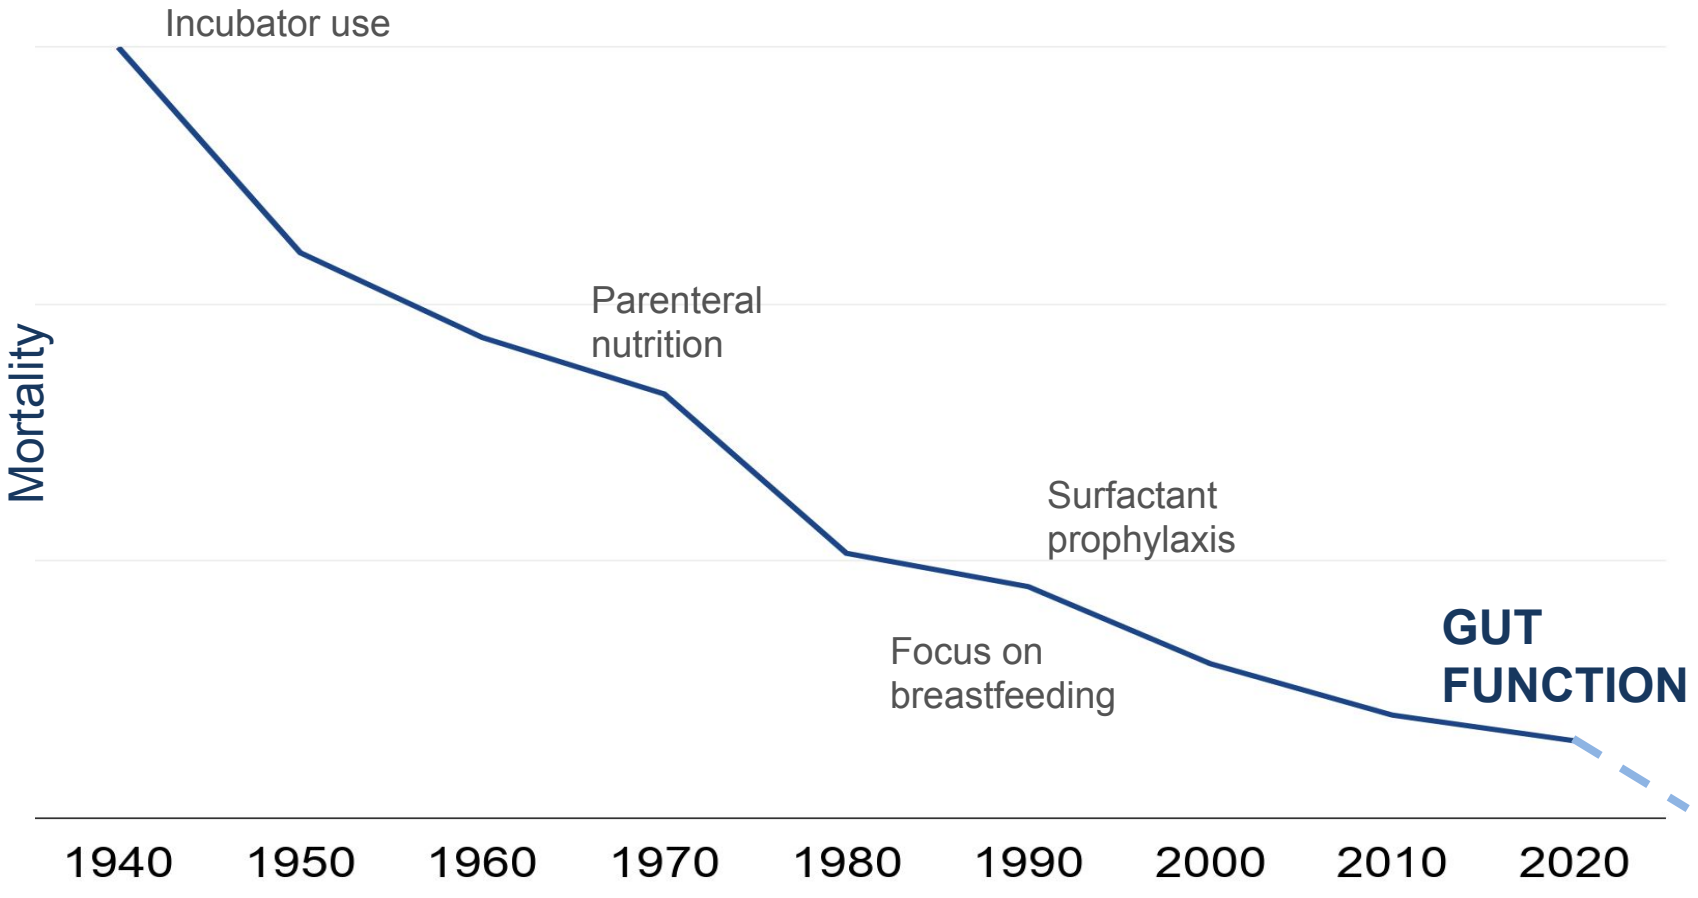
Mario A. Rojas, Juan M. Lozano, Maria X. Rojas, Viviana A. Rodriguez, Martin A. Rondon, Jaime A. Bastidas, Luis A. Perez, Catherine Rojas, Oscar Ovalle, Jorge E. Garcia-Harker, Maria E. Tamayo, Gloria C. Ruiz, Adriana Ballesteros, Maria M. Archila and Mauricio Arevalo

Pediatrics 2012;130;e1113; originally published online October 15, 2012; DOI: 10.1542/peds.2011-3584

High unmet medical need

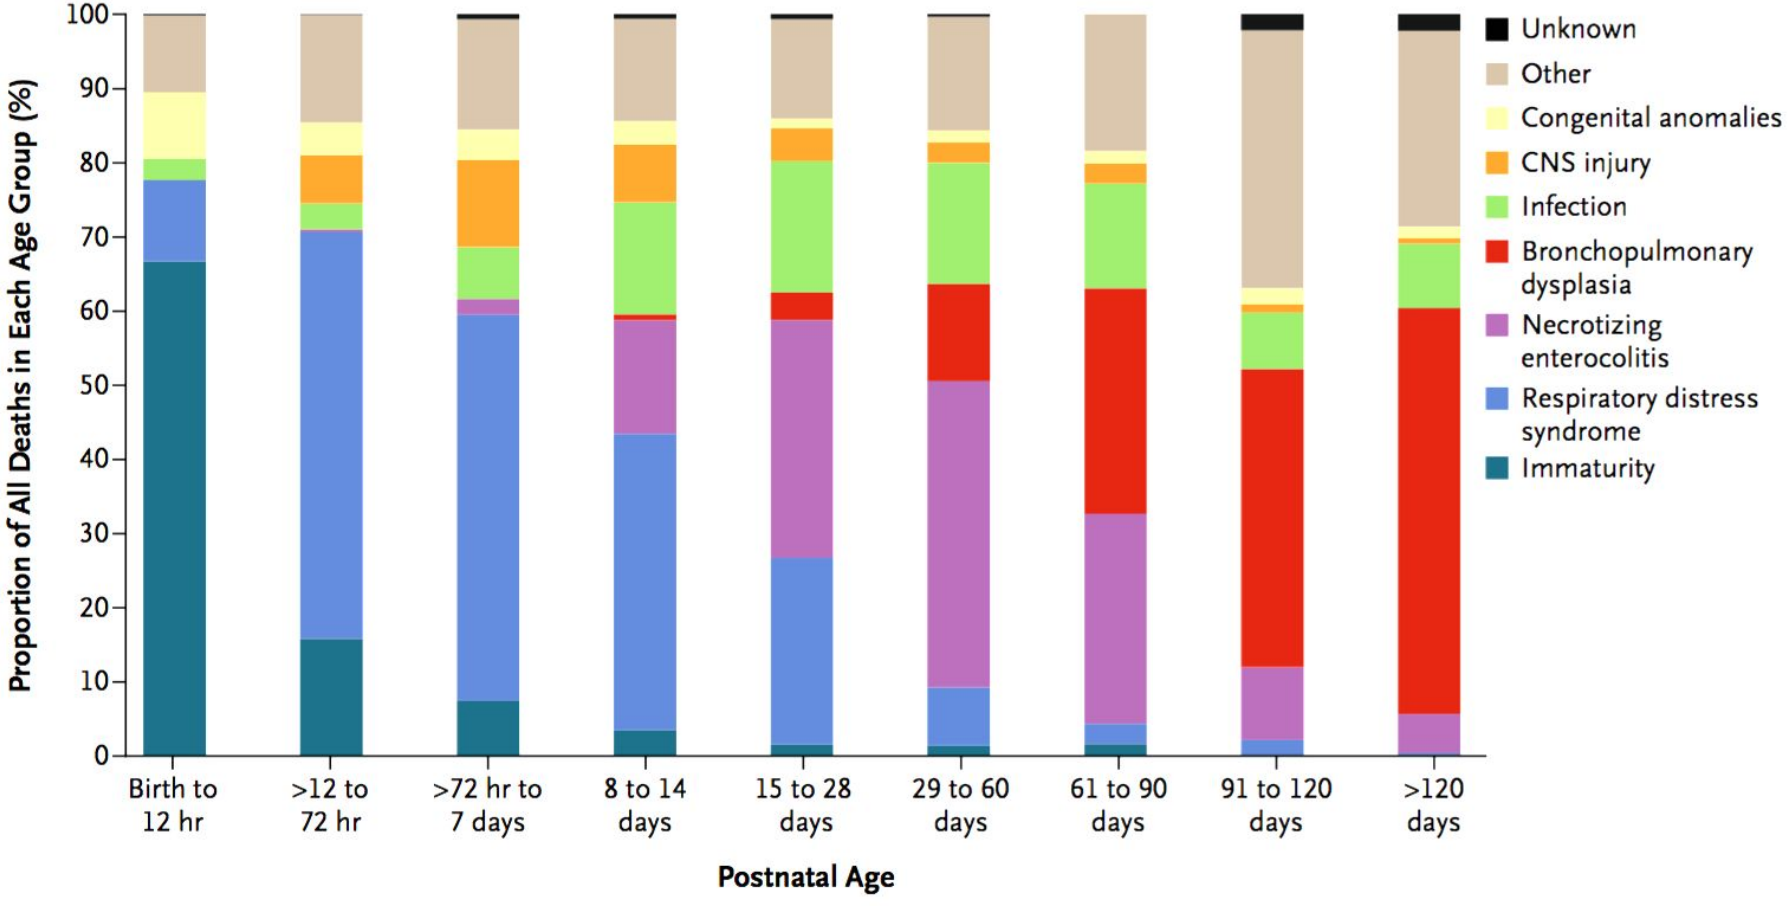
Our patients

GI tract left untreated in preterm infants



CDC/NCHS, National Vital Statistics System

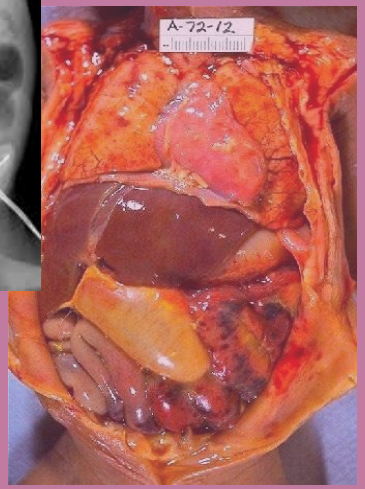
Causes of death



Patel 2015

Necrotizing enterocolitis (NEC)

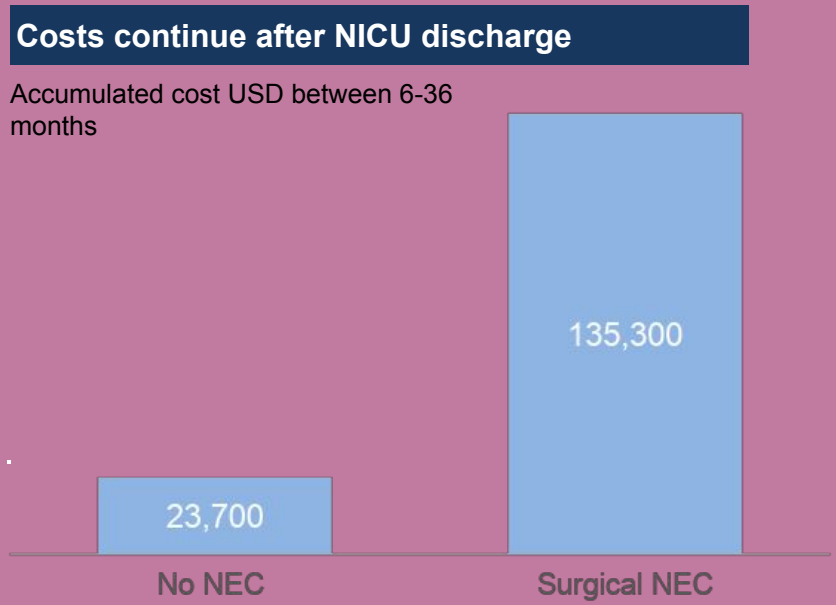
- NEC is severe inflammation of the bowel in preterm infant where 20-40% need complicated and costly surgery
- Survivors have long-term consequences such as short-bowel syndrome, abnormal growth, cognitive, visual and hearing impairments
- There is no therapy available today
- **NEC is one of the leading causes of death in the Neonatal intensive care unit (NICU) with up to 40% morbidity rate killing 1500 US and 3700 EU infants each year**



Simpson 2010, Clark 2012

Economic burden of NEC

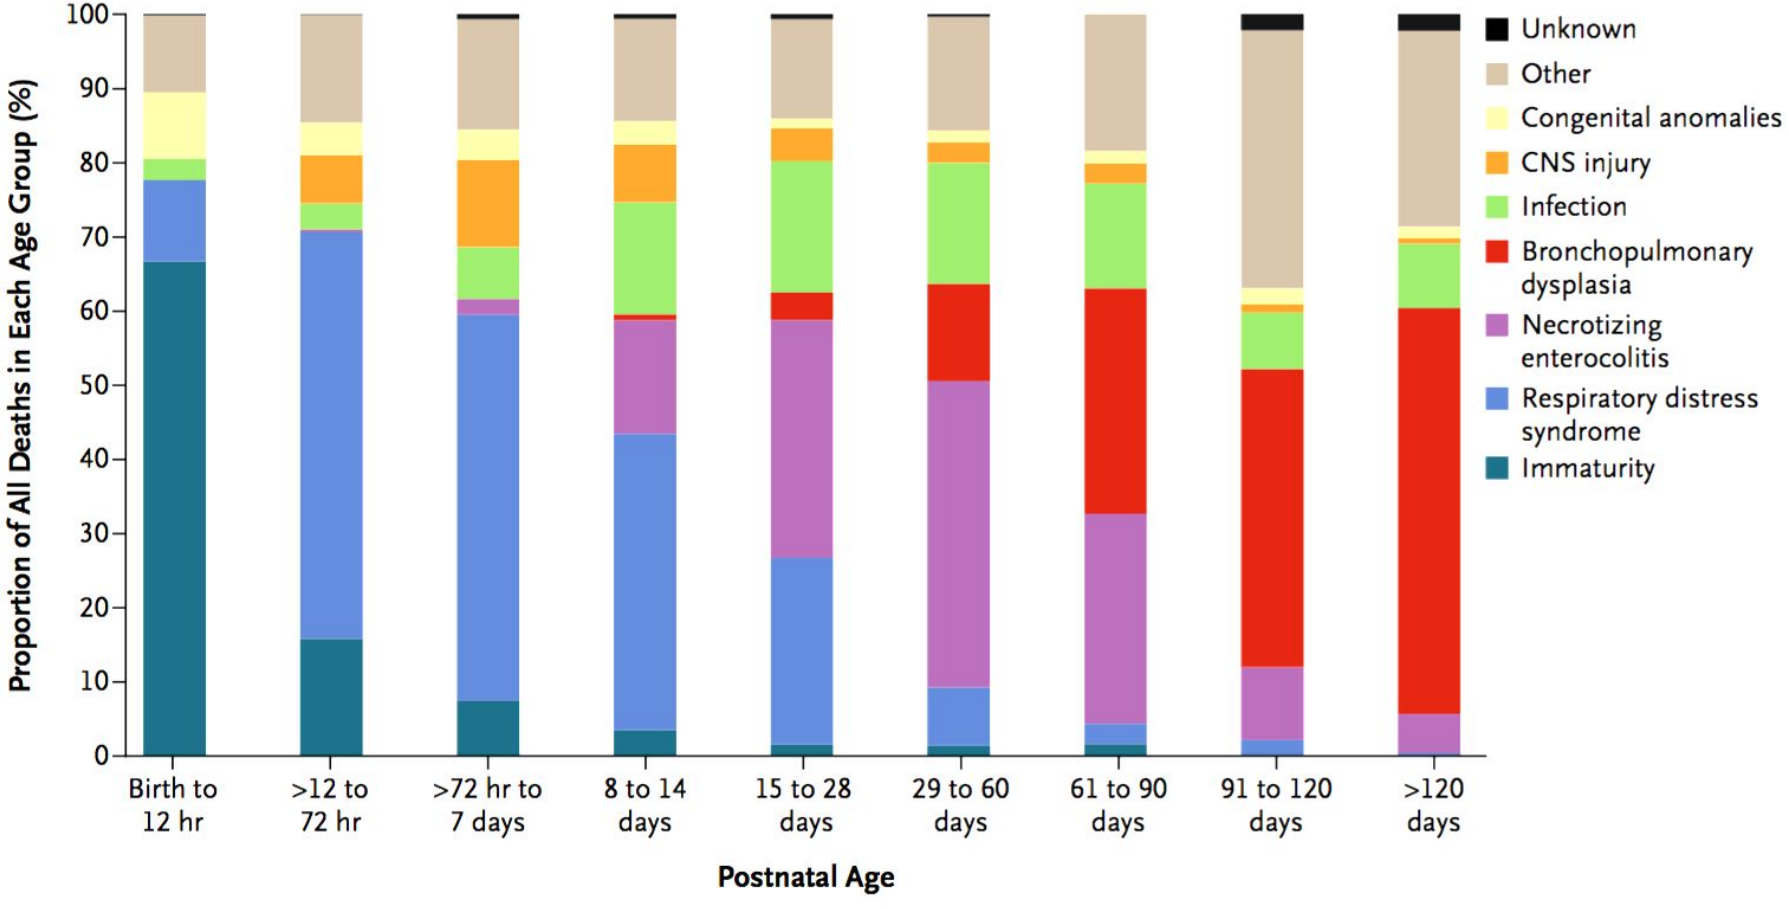
NEC Economic Burden is estimated to be 20% of the total cost of initial care and USD 5 Billion spent annually on NEC in the US.



Long term costs associated with sequelae such as impaired growth, short bowel syndrome and poor neurodevelopment

Ganapathy 2011, 2013

Causes of death



Patel 2015

Feeding the preterm infant

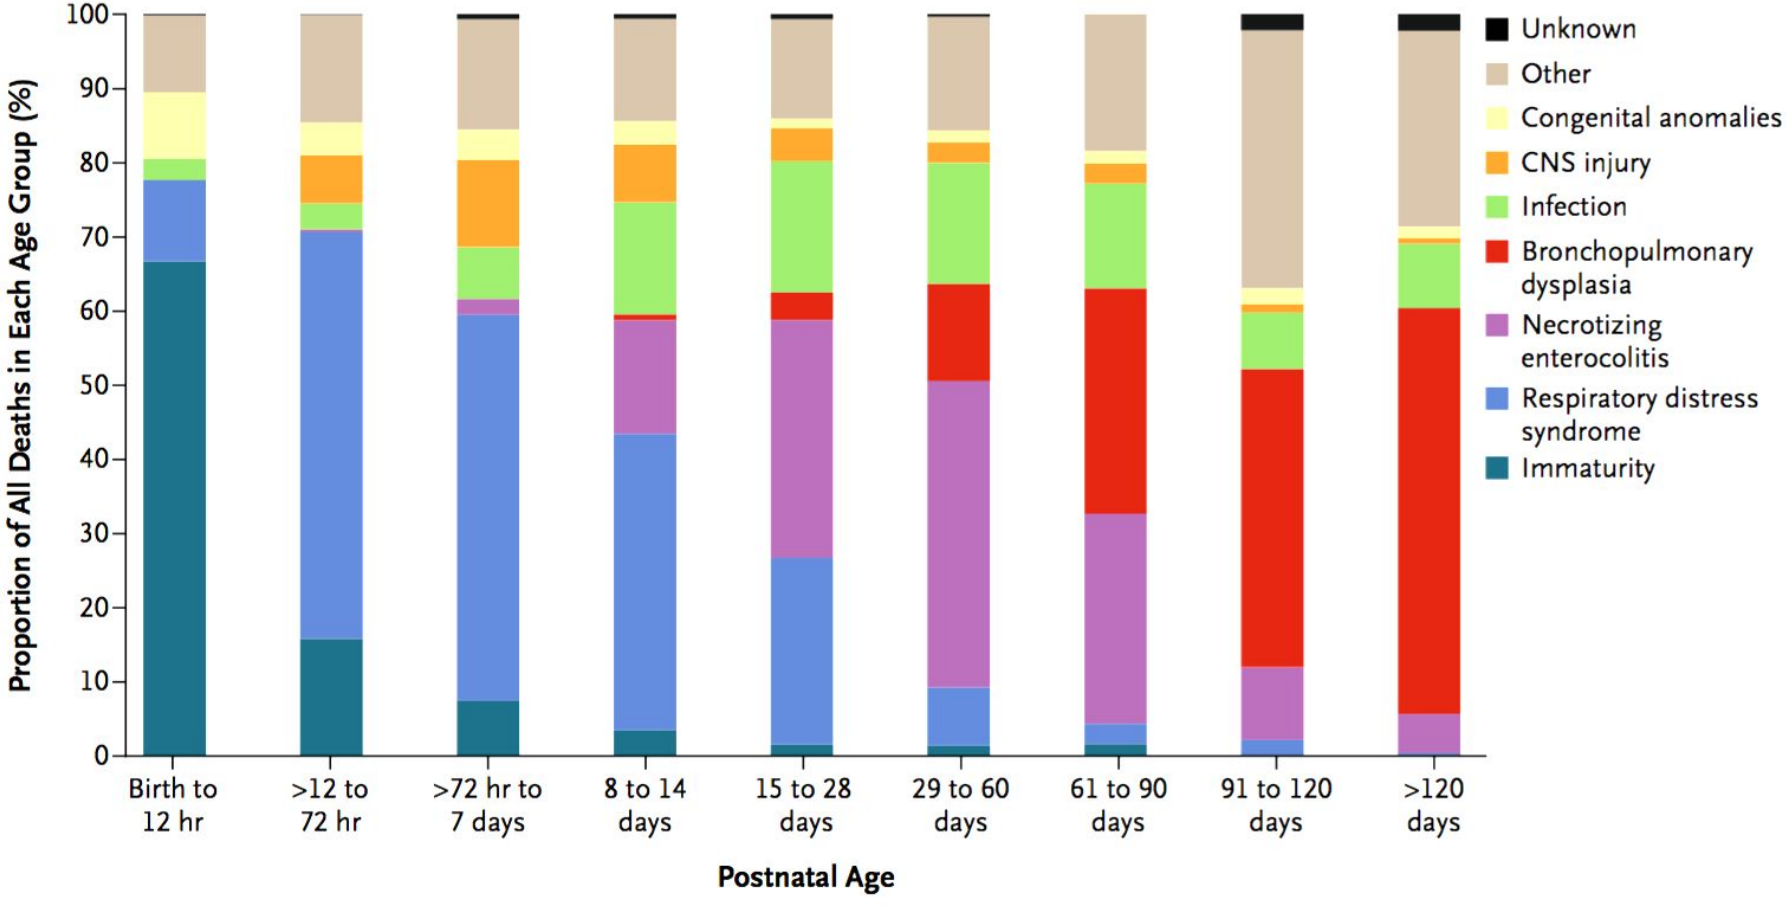
- Establishing enteral (mouth) feeding in preterm infants to establish “catch up growth” that is important for e.g. cognitive development.

- Prolonged parenteral (needle feeding) nutrition increases cost and causes complications: cholestasis, increased risk of BPD, pulmonary vascular resistance, infections and sepsis.

Despite intensive nutritional strategies for premature infants, growth failure remains a major problem

Murgas-Torrazza, 2013; Agostoni, 2010

Causes of death



Patel 2015

Feeding the preterm infant

- Prolonged parenteral (needle feeding) nutrition increases cost and causes complications: cholestasis, increased risk of BPD, pulmonary vascular resistance, infections and sepsis.

- Establishing enteral (mouth) feeding is one important goal in preterm infants
for “catch up growth”, for development and to combat intestinal damage.

Despite intensive nutritional strategies for premature infants, growth failure remains a major problem

Murgas-Torrazza, 2013; Agostoni, 2010

Feeding the preterm infant

- Prolonged hospital stay of the preterm infant is associated with a high direct cost burden - $3,200 per day

- Long Term: Improved growth velocity improves neurodevelopmental outcomes in extremely low birth weight infants

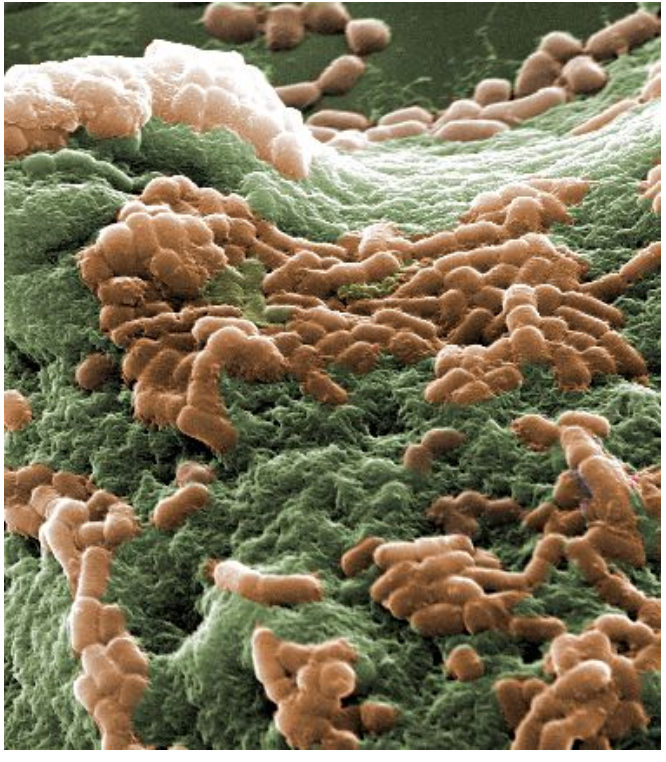
Ganapathy, 2011 and Ehrenkranz et al 2006

MECHANISM OF ACTION –*Lactobacillus reuteri*

Lactobacillus reuteri

Active substance of IBP-9414

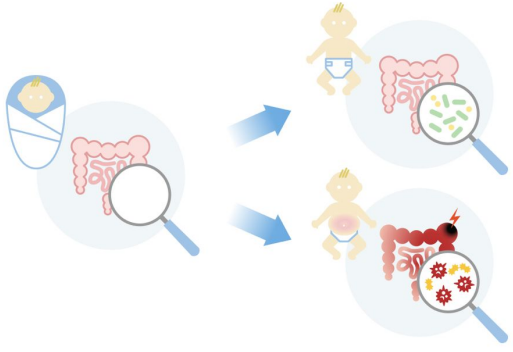
Lactobacillus reuteri present on women's breasts

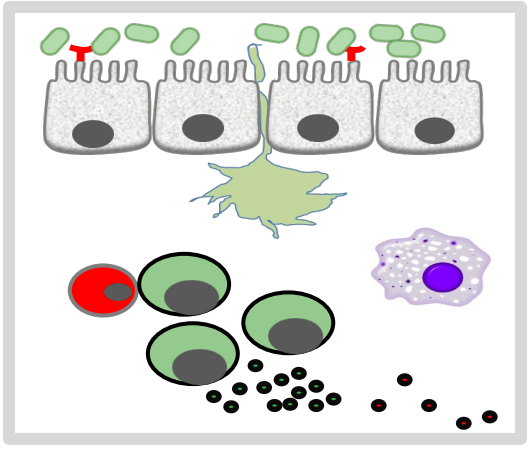


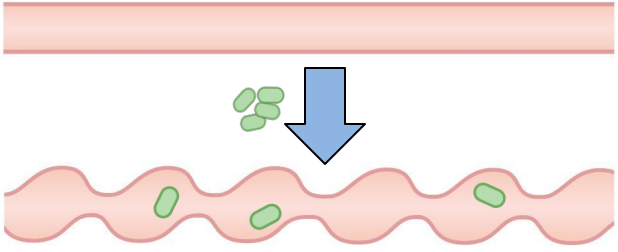
Lactobacillus reuteri (orange) adhering to intestinal mucus

Picture with the permission Versalovic

L. reuteri mechanisms of action







Combats dysbiosis

Reduces inflammation

Improves gut motility

Improved GUT function!

Short term: reduction of NEC and Sepsis

Long term: catch up growth for preterm leading to e.g. better cognitive function

CLINICAL EFFICACY SIGNAL – *L. reuteri*

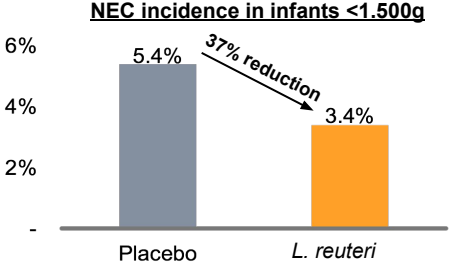
9 studies show clinically significant reduction of NEC

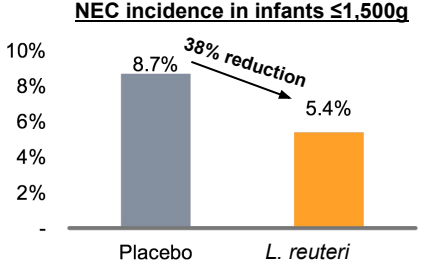
Study	Number of patients	Reduction in NEC incidence
Rojas et al. (2012)	▪ 750 patients	▪ 40% in the total study population ▪ 37% in infants ≤1,500g
Oncel et al. (2014)	▪ 400 patients	▪ 20% in the total study population ▪ 38% in infants ≤1,000g
Spreckels et al. (2018)	▪ 104 patients	▪ 53% in infants ≤1,000g
Hunter et al. (2012) & Dimaguila et al. (2013)	▪ 354 patients	▪ 89% in the total study population
Sanchez Alvarado (2017)	▪ 225 patients	▪ 64% in infants ≤1,500g
Rolnitsky et al. (2017)	▪ 937 patients	▪ 49% in the total study population
Jerkovic Raguz et al. (2016)	▪ 100 patients	▪ 50% in the total study population
Shadkam et al. (2015)	▪ 60 patients	▪ 82% in the total study population
Hernandez-Enriquez et al. (2016)	▪ 44 patients	▪ 92% in the total study population

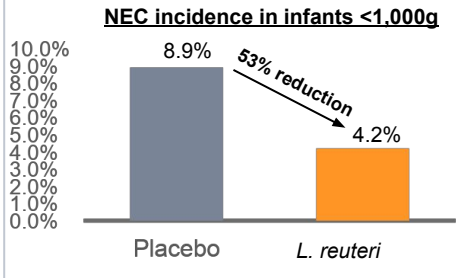
Clear clinical signal (1/4)

Randomised double-blind placebo-controlled clinical studies indicate reduction of NEC

	1 Rojas et al. (2012)	2 Oncel et al. (2014)	3 Spreckels et al. (2018)
Aim of the study	▪ Determine whether prophylactic administration of *L. reuteri* to pre-term infants reduces the incidence of the composite outcome of death or nosocomial infection	▪ Evaluate the effect of administration of *L. reuteri* on the incidence and severity of NEC and sepsis in very low-birth-weight infants	▪ Measure the colonization rate of *L. reuteri* and relate the colonization rate to antibiotic treatment and clinical outcomes
Target population	▪ Infants ≤2,000 g birth weight split into <1,500 and 1,501g-2,000g	▪ Infants ≤32 GA weeks and ≤1,500g birth weight	▪ Infants ≤28 GA weeks and <1,000g birth weight
Method	▪ Placebo-controlled trial conducted in 9 Columbian NICUs between 2008-2011	▪ Placebo-controlled trial conducted in Turkey between Feb-12 – Feb-13	▪ Placebo-controlled trial conducted in Sweden between 2012-2015
# of patients	▪ 750 patients (372 *L. reuteri* and 378 placebo)	▪ 400 patients (200 *L. reuteri* and 200 placebo)	▪ 104 patients (48 *L. reuteri* and 56 placebo)
Results	▪ 40% reduction in NEC incidence in the total study population ▪ 37% reduction in NEC incidence in infants ≤1,500g ▪ No infections and no adverse effects	▪ 20% reduction in NEC incidence in the total study population ▪ 38% reduction in NEC incidence in infants ≤1,000g ▪ No infections and no adverse effects	▪ 53% reduction in NEC incidence in infants ≤1,000g







Clear clinical signal (2/4)

Retrospective cohort clinical studies indicate reduction of NEC

	4 Hunter et al. (2012) & Dimaguila et al. (2013)	5 Jerkovic Raguz et al. (2016)
Aim of the study	▪ Examine the potential benefit of administering *L. reuteri* on the rate of NEC in extremely low-birth-weight infants	▪ Analyse the treatment, course and outcome of premature infants treated with *Lactobacillus reuteri*
Target population	▪ Infants ≤1,000g birth weight	▪ Premature infants of GA between 30-34 weeks
Method	▪ Retrospective comparison of the rates of NEC in neonates before and after the introduction of *L. reuteri* routine use	▪ Retrospective cohort study with comparison of outcomes before and after the introduction of *L. reuteri*.
# of patients	▪ 354 patients (232 before and 122 after the introduction of *L. reuteri)*	▪ 100 patients (50 before and 50 after the introduction of *L. reuteri*)
Results	▪ Reduction in NEC incidence in neonates who received *L. reuteri* (2.5%) vs. others (15.1%) ▪ Additional data from Dimaguila et al. (2013) (1.6% vs. 15.1%) ▪ No infections and no adverse effects 	▪ The incidence of NEC was reduced from 8% to 4% after the initiation of *L. reuteri* use **NEC incidence in all enrolled infants** 
Clear clinical signal (3/4)

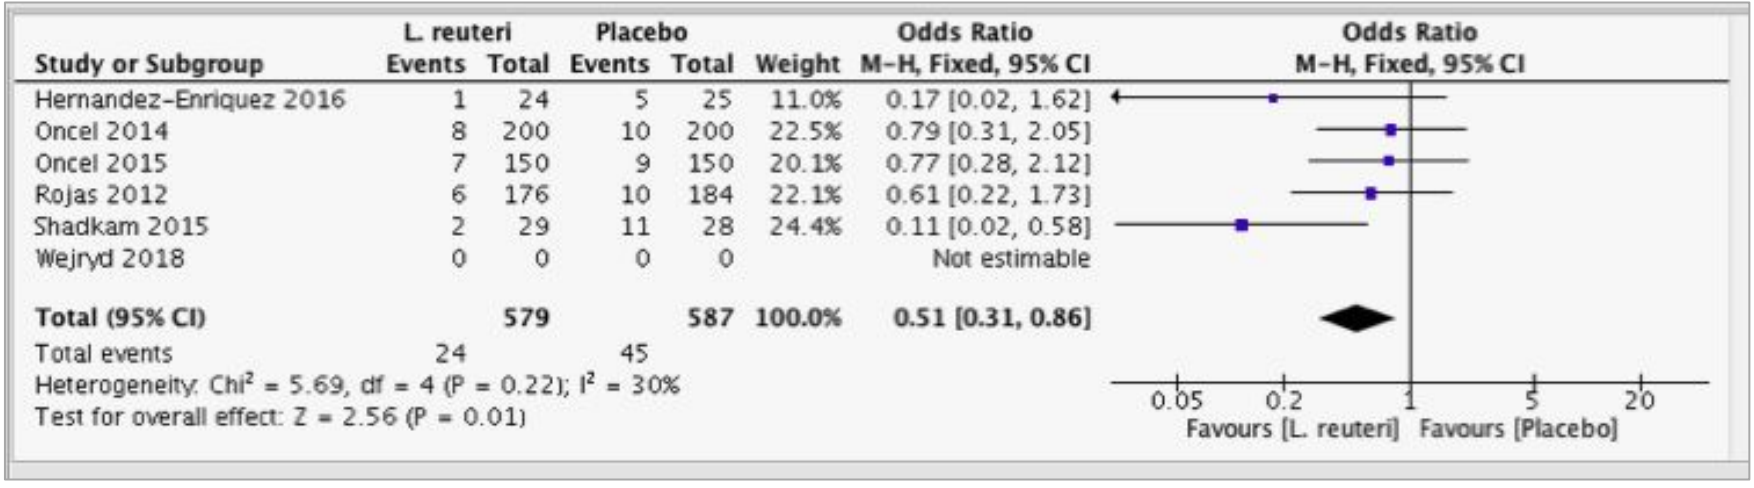
Retrospective cohort clinical studies indicate reduction of NEC

	6 Sanchez Alvarado (2017)	7 Rolnitsky et al. (2017)
Aim of the study	▪ Demonstrate that the use of *Lactobacillus reuteri* prevents NEC in premature infants <1,500g birth weight	▪ Quality improvement study to reduce NEC rates in infants in the NICU by treating with *Lactobacillus reuteri*
Target population	▪ Infants ≤1,500g birth weight	▪ Premature infants of GA <33 weeks
Method	▪ Retrospective comparison of medical records of infants treated or not treated with *L. reuteri*	▪ Retrospective cohort study with comparison of outcomes before and after the introduction of *L. reuteri*.
# of patients	▪ 225 patients (75 on *L. reuteri* and 150 controls)	▪ 937 patients (330 before and 607 after the introduction of *L. reuteri*)
Results	▪ NEC incidence was reduced from 14.6% to 5.3% with *L. reuteri* use ▪ Number needed to treat (NNT): 11 	▪ NEC incidence was reduced from 6.0% to 2.9% in infants <1,500g birth weight after the initiation of *L. reuteri* use 
Clear clinical signal (4/4)

Other studies indicating reduction of NEC

	8 Shadkam et al. (2015)	9 Hernandez-Enriquez et al. (2016)
Aim of the study	▪ Evaluate the effects of *Lactobacillus reuteri* on the gastrointestinal complications and feeding tolerance in premature infants	▪ Evaluate the effectiveness of the use of *Lactobacillus reuteri* to reduce the incidence of NEC in infants with very low birth weight
Target population	▪ Premature infants with weight between 1,000 – 1,800g	▪ Very low birth weight infants < 1,500g and GA < 34 weeks
Method	▪ Randomised blinded clinical trial conduced at NICU between October 2012 – March 2013	▪ Randomised controlled trial conducted in a Mexican NICU between May 2012 and May 2013
# of patients	▪ 60 patients (30 *L. reuteri* and 30 placebo)	▪ 44 patients (24 *L. reuteri* and 20 no treatment)
Results	▪ Incidence of NEC in infants administered with *L. reuteri* (6.7%) was lower than the placebo group (36.7%) 	▪ The incidence of suspected NEC was much lower in the group that received *L reuteri* (1/24, 4%) vs. the group that received no treatment (10/20, 50%) 
NEC clinical signals

Incidence of NEC



Meta-analysis: NEC <1500g all randomized controlled trials gives an Odds Ratio of 0.51

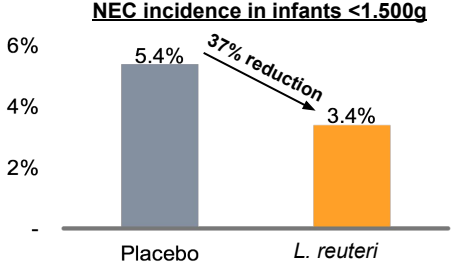
L. reuteri demonstrates clear signal on improved feeding tolerance

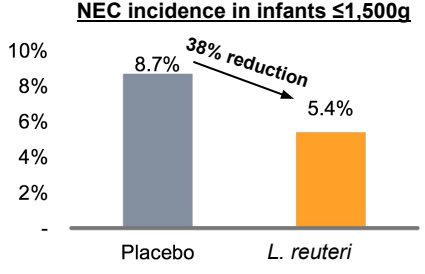
Study	Number of patients	Results
Rojas et al. (2012)	▪ 750 patients	▪ 34% reduction in episodes of feeding intolerance (p=0.08)
Oncel, et al. (2014)	▪ 400 patients	▪ 29% reduction in episodes of feeding intolerance (p=0.015)
Oncel et al. (2015)	▪ 300 patients	▪ 36% reduction in episodes of feeding intolerance (p=0.004)
Rolnitsky et al. (2018)	▪ 937 patients	▪ 52% reduction in episodes of feeding intolerance (p<0.01)

Clear clinical signal (1/2)

Randomised double-blind placebo-controlled clinical studies indicate improved feeding tolerance

	1 Rojas et al. (2012)	2 Oncel et al. (2014)
Aim of the study	▪ Determine whether prophylactic administration of *L. reuteri* to pre-term infants reduces the incidence of the composite outcome of death or nosocomial infection	▪ Evaluate the effect of administration of *L. reuteri* on the incidence and severity of NEC and sepsis in very low-birth-weight infants
Target population	▪ Infants ≤2,000 g birth weight split into <1,500 and 1,501g-2,000g	▪ Infants ≤32 GA weeks and ≤1,500g birth weight
Method	▪ Placebo-controlled trial conducted in 9 Columbian NICUs between 2008-2011	▪ Placebo-controlled trial conducted in Turkey between Feb-12 – Feb-13
# of patients	▪ 750 patients (372 *L. reuteri* and 378 placebo)	▪ 400 patients (200 *L. reuteri* and 200 placebo)
Results	▪ 40% reduction in NEC incidence in the total study population ▪ 37% reduction in NEC incidence in infants ≤1,500g ▪ No infections and no adverse effects	▪ 20% reduction in NEC incidence in the total study population ▪ 38% reduction in NEC incidence in infants ≤1,000g ▪ No infections and no adverse effects





Feeding tolerance – clinical signals

STRONG INTEREST FROM THE MARKET

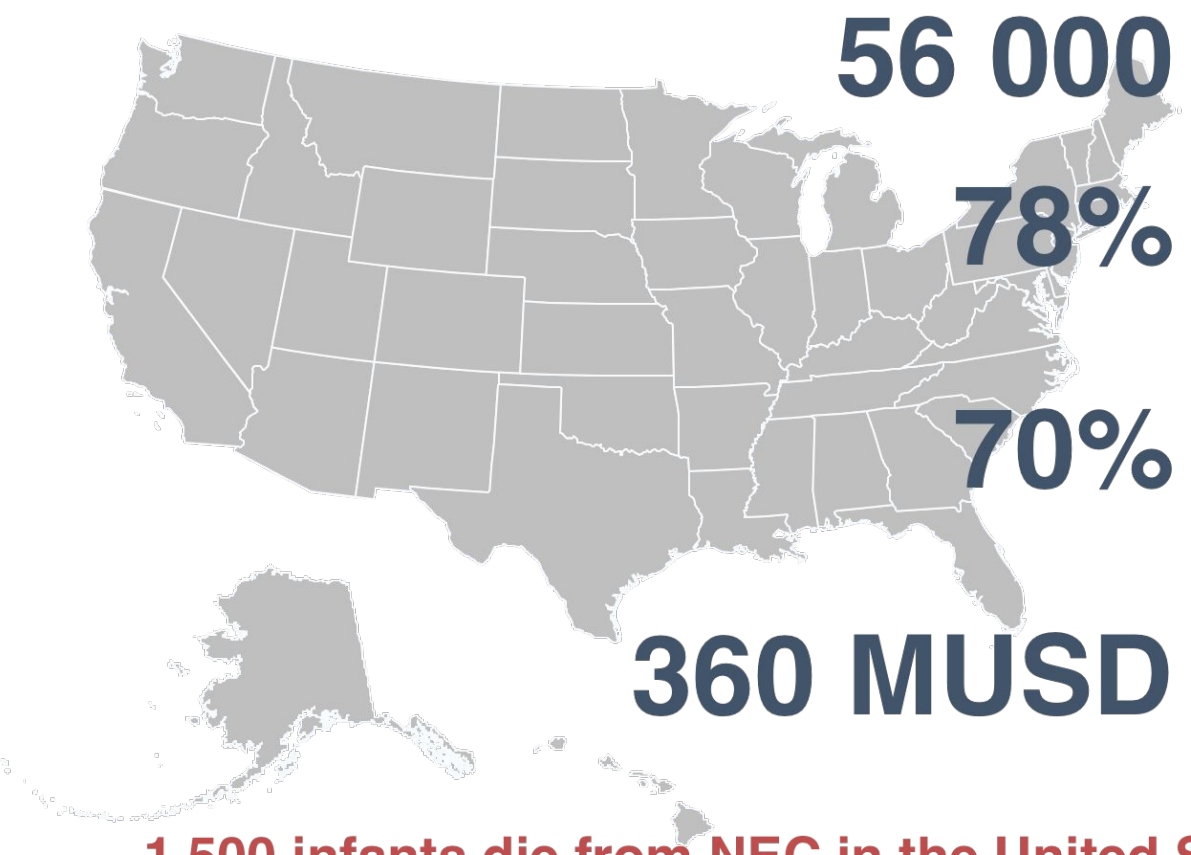
IBP-9414 Target Product Profile

For the prevention of necrotizing enterocolitis

Product description	▪ Oral suspension ▪ Supplied as a freeze-dried powder in a prefilled, clear, glass vial ▪ To be reconstituted in sterile water and delivered in enteral syringe
Administration	▪ Once daily until gestational age 34 weeks ▪ Administered enterally through the nasogastric or orogastric tube
Product efficacy	▪ Demonstrates 33% reduction in the incidence of NEC compared to standard of care alone
Safety profile	▪ Well tolerated with no known side effects ▪ No increase in risk of sepsis or multi-resistance to antibiotics ▪ No known contraindications

A valuable pharmaceutical

Results of market analysis by ClearView Healthcare Partners



56 000

Number of infants born under 1,500 grams in the United States annually

78%

Physician preference share demonstrates neonatologists show high willingness to prescribe IBP-9414

70%

Of addressable patients are anticipated to receive care at an institution that includes IBP-9414 on formulary

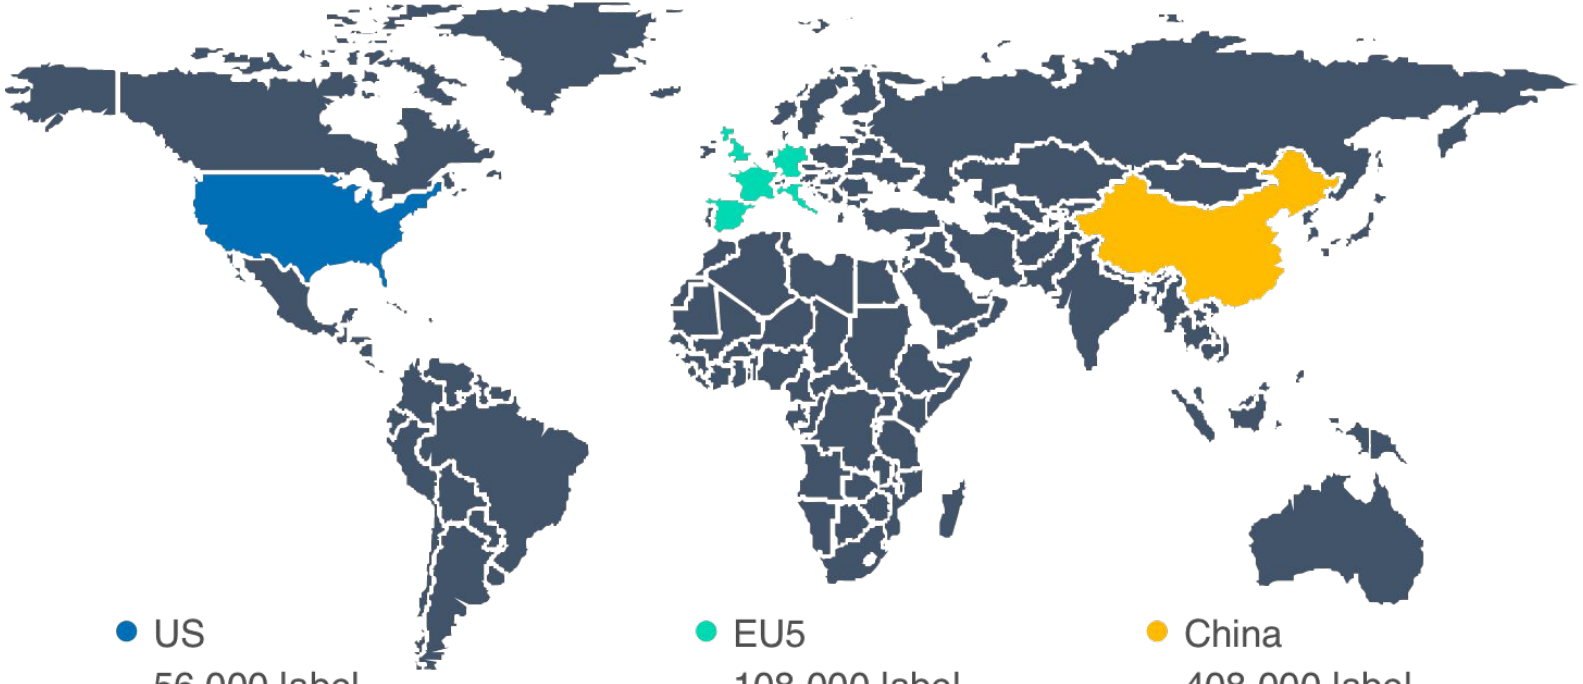
360 MUSD

Estimated annual revenue potential in US based on ClearView market research

1 500 infants die from NEC in the United States each year

A global need

15 Million Pre-term births annually



- US
  56 000 label population = 360 MUSD annual sales for NEC prevention
- EU5
  108 000 label population
- China
  408 000 label population

Plan for 2019 and beyond

- Commence Phase III - “The Connection Study” that IBT needs to register the IBP-9414 drug to allow sales of product (CTA/IND filed in US, UK, FR, SP, HU and hopefully this week in Israel)

- Finding good partners, e.g. like Megapharm in Israel, for distribution of the IBP-9414 drug around the world.

- Market research to better understand the markets behavior around “poor gut function and feeding problems in preterm babies”

- Progress the Gastroschisis project, IBP-1016, and possibly two additional possible indications based on *L. reuteri*

- Explore New Live Bacterial Platforms: New patent possibilities, not necessarily involving the use of *L. reuteri* bacteria

IBP-9414 our lead Phase III program

Ticks all relevant pillars for the development of a successful drug

Infant Bacterial Therapeutics

Overview

- Pharmaceutical microbiome company focused on areas of unmet medical need
- Lead drug candidate IBP-9414, to prophylactically prevent necrotizing enterocolitis ("NEC"), a fatal, rare disease that afflicts premature infants and reduce feeding intolerance in the same patient group
- Opportunity for second rare disease program IBP-1016 for the treatment of an unmet medical need in gastroschisis, a severe disease in infants

- Orphan Drug Designation from FDA and EMA
- Rare Pediatric Disease Designation granted
- Exclusive royalty free worldwide license to patents
- Market Approval for IBP-9414 target 2021

- Financial resources sufficient finance development to application for market approval
- Listed on Nasdaq Stockholm Mid-Cap IBTB:SS,
- Third party assessed opportunity - USD 360m in US market for IBP-9414
- Priority Review Voucher eligible

Feeding the preterm infant

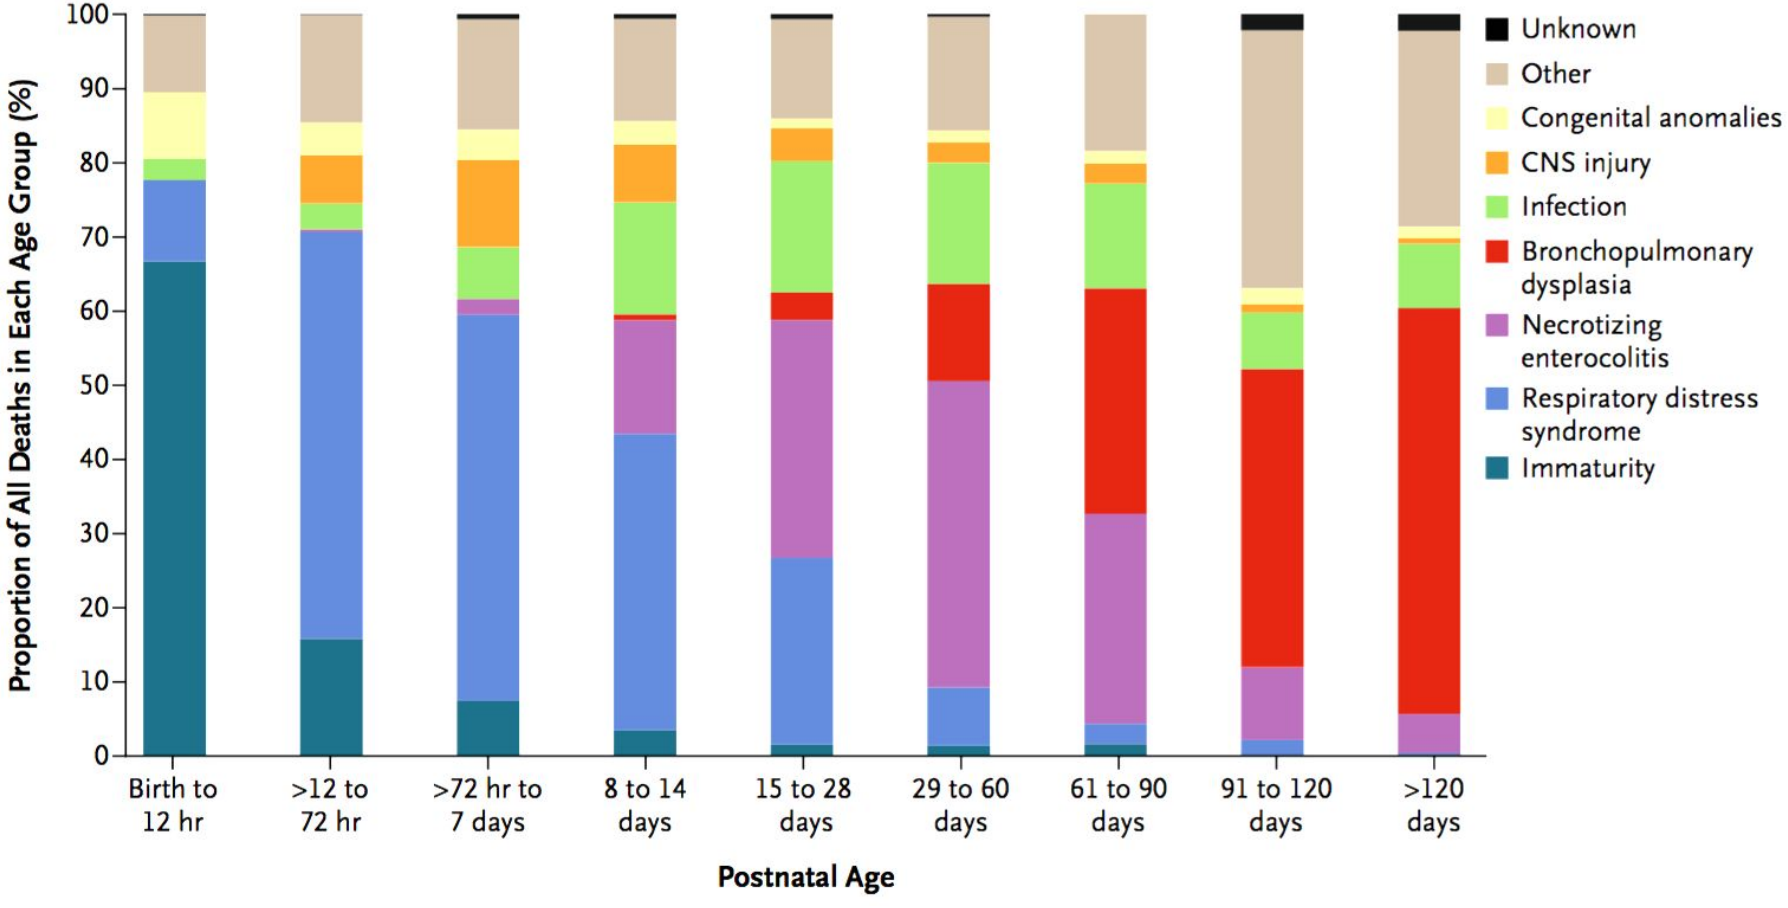
- Prolonged parenteral (needle feeding) nutrition increases cost and causes complications: cholestasis, increased risk of BPD, pulmonary vascular resistance, infections and sepsis.

- Establishing enteral (mouth) feeding is one important goal in preterm infants
for “catch up growth”, for development and to combat intestinal damage.

Despite intensive nutritional strategies for premature infants, growth failure remains a major problem

Murgas-Torrazza, 2013; Agostoni, 2010

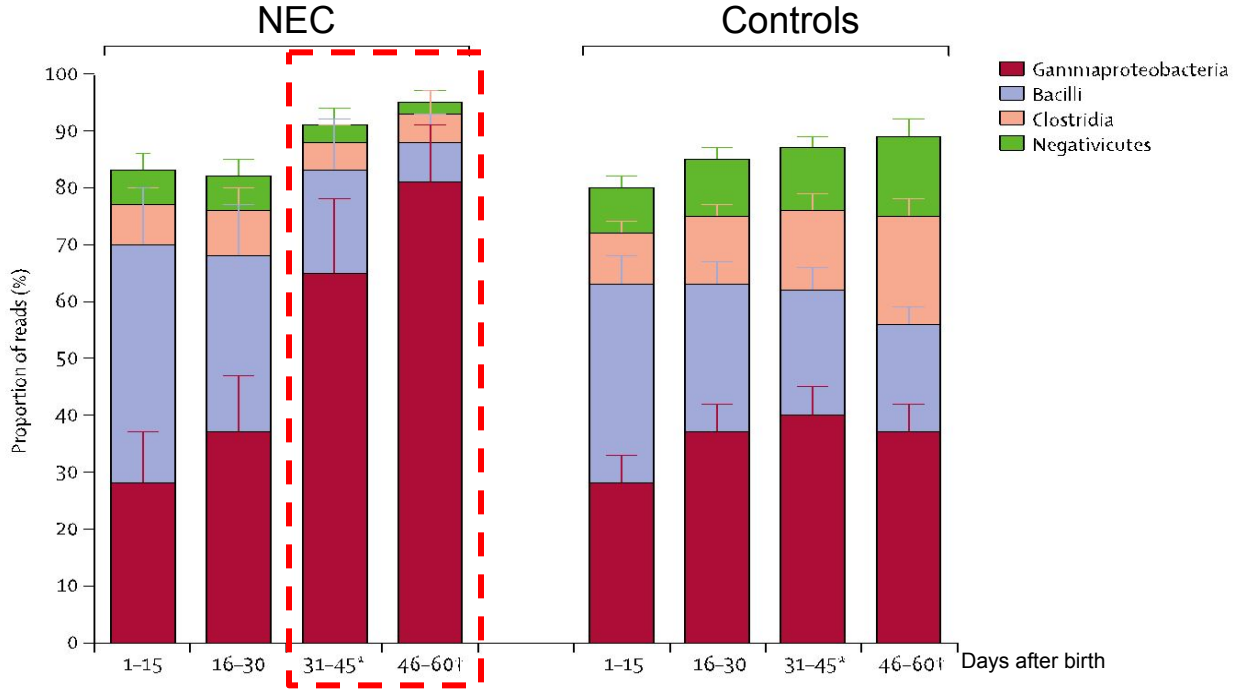
Causes of death



Patel 2015

Dysbiosis in NEC

Dysbiosis with pathogen blooms in the microbiota can contribute to necrotizing enterocolitis in preterm infants



Bloom of pathogen-rich gamma proteobacteria prior to onset of NEC

Microbiome optimization may provide a novel strategy for preventing NEC

Warner et al, 2016, Pammi et al. 2017

Anti-pathogen effects *in vitro*

L. reuteri produces species-specific antimicrobial substance called reuterin

Bacteria

- *Bacillus subtilis*
- *Listeria monocytogenes*
- *Campylobacter jejuni*
- *Porphyromonas gingivalis*
- *Clostridium perfringens*
- *Prevotella intermedia*
- *Clostridium difficile*
- *Pseudomonas fluorescens*
- *Escherichia coli (patogena)*
- *Salmonella typhimurium*
- *Enterobacter sakazakii*
- *Shigella spp*
- *Fusobacterium nucleatum*
- *Staphylococcus aureus*
- *Helicobacter pylori*
- *Streptococcus mutans*

Yeast and fungi

- *Candida albicans*
- *Aspergillus flavus*
- *Fusarium samiaciens*

L. reuteri* inhibits *S. aureus

L. reuteri inhibits the growth of pathogens
